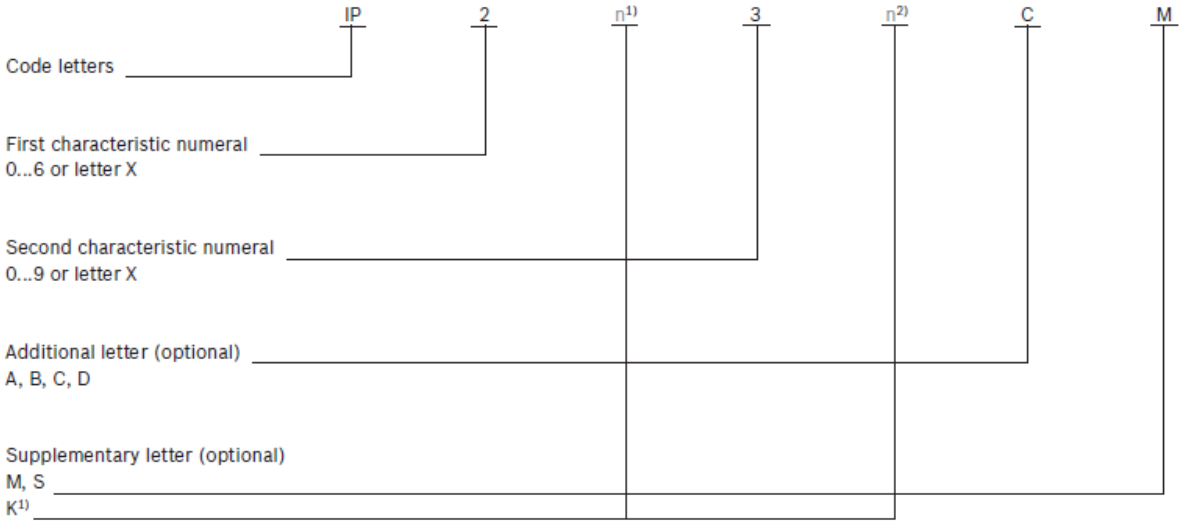
Sensor IP degrees

IP degrees of protection
Valid for the electrical equipment of road vehicles as per DIN 40 050 (Part 9).
- ► Protection of the electrical equipment inside the enclosure against the effects of solid foreign objects including dust.
- ► Protection of the electrical equipment inside the enclosure against the ingress of water.
- ► Protection of persons against contact with dangerous parts, and rotating parts, inside the enclosure.

Structure of the IP code



If a characteristic numeral is not given, it must be superseded by the letter "X" (i. e. "XX" if both characteristic numerals are not given).
The supplementary and/or additional letters can be omitted at will, and need not be superseded by other letters.

1) The supplementary letter "K" is located either directly after the first characteristic numerals 5 and 6, or directly after the second characteristic numerals 4, 6 and 9.

2) During the water test. Example: IP16KB protection against the ingress of solid foreign bodies with diameter ≥ 50 mm, protection against high-pressure hose water, protection against access with a finger.

CE-Identification and manufacturer declaration with EU directive

As under the EU Directive all electrically-powered machines, devices and systems, which are manufactured, imported and sold within the borders of the European Union must have a CE-label attached to them. The EU Directive also includes the following individual guidelines, which are of significance for sensor users.

1. Machine Directive
It is valid for self-contained operational machines or any interlinking of machines to form integral systems. It is not valid for machine components however, such as, for example, electrical control systems or sensors which have no independent function. The entire machine or system must always comply with the Directive.

2. EMC Directive
This Directive is valid for all electrical and electronic devices, installations and systems. However, this Directive is also valid for complex components such as, e.g. sensors, although this only applies were they are openly available for purchase by the public. The sensors listed in this catalogue are solely shipped as supplied parts or replacement parts, and are not subject to § 5 paragraph 5 of the EMC Act regarding a mandatory CE label. The limits for the relaying and the radiation of high-frequency interference are specified in EN 55014 of the EMC Act. Because of the previously-mentioned reasons, Bosch sensors are on no account subject to mandatory CE labeling. We will gladly assist you with information in all matters relating to the acceptance of your application.

Liability disclaimer

For applications listed in the catalogue, prior clarification of the technical suitability is imperative. All listed products are designed for automotive vehicles in its intended use. If you use these products within specification, but outside its intended use, you are responsible for establishing the suitability of our products for your intended purpose, if other than for its approved application (in particular, if subjected to different loads or under different technical conditions) by taking suitable action (especially testing). We would like to point out to you that the responsibility for the overall system also lies solely with you.

If your application cannot be solved with this range of products or in case you need our consultancy, please inform us about your requirements and contact us via e-mail address www.bosch-ibusiness.com/contact/

1.1 Air-mass sensors

HFM with analog interface

- ► Nominal air-flow up to 1.050 kg/h
- ► Analog interface
- ► Compact design
- ► Low weight
- ► Fast response time
- ► Low power input
- ► Pulsation flow detection

Application

The air-mass sensor (HFM) is designed to measure the air mass and temperature of the intake air in motor vehicles with diesel and gasoline applications. The sensor measures the actual air mass flow rate for an optimized air-fuel mixture, supporting an efficient fuel combustion and powerful engine performance.

Design and operation

The standard HFM consists of a plug-in sensor and cylinder housing. The electronic module, with the evaluation circuit and the sensor element, is located in the plug-in sensor. The sensor element is positioned on the electronic module and extends into the metering duct (bypass channel) of the connector housing. The location of the temperature sensor (NTC) is on the backside of the connector housing.

The HFM is a thermal flowmeter. From the intake air flow within the cylinder housing, a portion of the total mass air flow will pass across the sensor element in the bypass channel. In the center exists a heating zone which is controlled to a certain temperature, depending on the temperature of the intake air. Without air flow, the temperature from the heating zone to the edges decreases linearly, and the temperature sensors up- and downstream of the heating zone indicate the same value. With air flow, the sensor area upstream will be cooled by the heat transfer in the boundary layer.

The downstream temperature sensor will keep its temperature because the air is heated as it passes over the heating zone. The temperature sensors show a temperature difference which depends on amount and direction of the air flow. The difference between the signals of the temperature sensors is evaluated in a bridge circuit.

Explanation of characteristic data

$\dot{m}_N$	Nominal airflow
$\Delta\dot{m}/\dot{m}$	Relative accuracy
$\tau\Delta$	Time until measurement error ≤ 5 %
τ_{63}	Time until change in measured value 63%

1.2 Air-mass sensors

HFM with digital interface – SENT interface

SENT interface

The SENT interface is a one-way asynchronous voltage interface which requires three wires: supply voltage, signal voltage and ground.

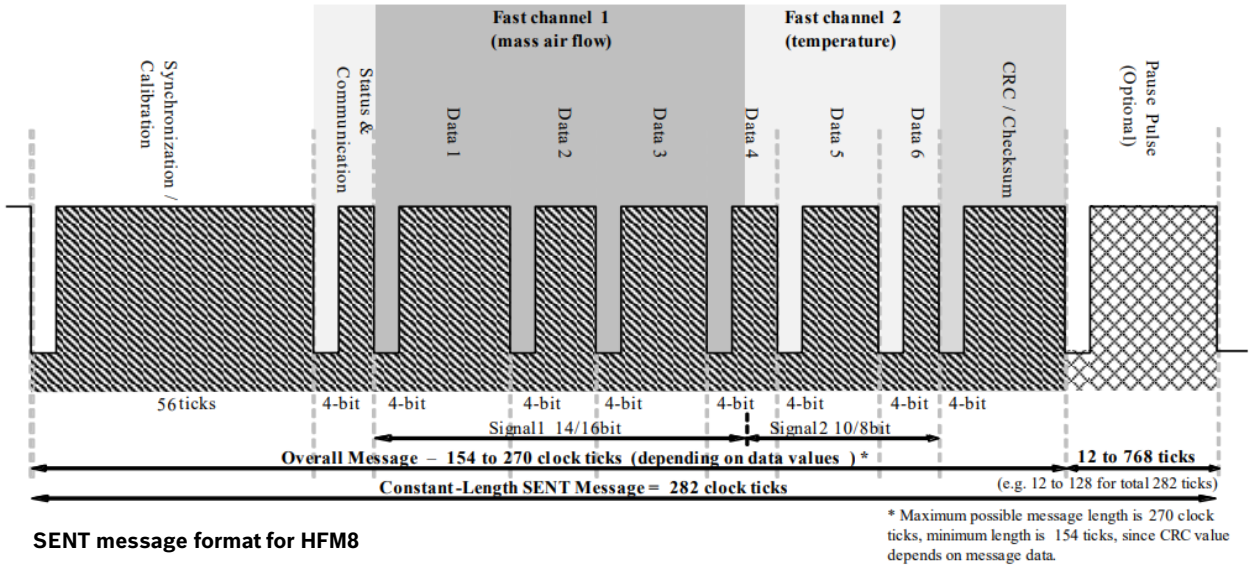
For HFM8 the transmission takes place in accordance with the following figure (SENT transmissions).

The air mass signal is read from Fast Channel 1 in 14-bit data format. The pressure signal is read from Fast Channel 2 in 10-bit data format.

The temperature signal and the signals of the humidity sensor are transmitted via the Slow Channel in 12-bit data format.

In addition, further signals and status information are transmitted in the Slow Channel.

Specified descriptions are to be inferred from the SAE SENT standard J2716 APR 2016.



SENT message format for HFM8

* Maximum possible message length is 270 clock ticks, minimum length is 154 ticks, since CRC value depends on message data.

1.3 Air-mass sensors

PFM pressure based flow meter

- ► Pressure range up to 4,5 bar
- ► Digital interface (SENT, 2 channels)
- ► Compact design
- ► Low weight
- ► Fast response time
- ► Efficient, robust & dynamic mass flow measurement
- ► High level of robustness & accuracy

Application

The pressure based air mass flow meter PFM is a sensor to measure the fresh air mass (without exhaust gas recirculation) within air ducts of CV-engines. It is usually mounted downstream of the charge air intercooler.

With the air mass flow measurement the fuel injection quantities can be optimized, which helps to minimize the exhaust gas emissions. The PFM detects the single values, which are used for the air mass flow calculation.

The single values are:
- Differential pressure (difference of total pressure and static pressure)
- Absolute pressure (static pressure)
- Temperature

Design and operation

The PFM measurement technique is based on the pitot-static tube concept, whereby two pressure sensors and one temperature sensor are installed in the sensor for the determination of the air mass flow. The differential pressure sensor is placed in the lower part of the sensor housing and its pressure taps are exposed to the air flow. Similarly, the temperature sensor is placed in the lower housing part to be directly immersed in the flow. The absolute pressure sensor is positioned in the upper part of the sensor housing, since its membrane does not have to be exposed to the flow.

The PFM is designed as a plug-in sensor, which is mounted in a measuring tube with three main parts: a nozzle, a measurement section and a diffusor. The design of the measurement tube uses engine specific data and conditions the flow for an optimal air mass flow measurement with the PFM.

The two analog pressure sensor signals are AD converted, the signal of the temperature sensor is digitized via the absolute pressure sensor. Finally, the sensor signals are transmitted to the ECU via the SENT communication protocol.

The sensor signals of
- the differential pressure sensor
- the absolute pressure sensor
- the temperature sensor

are the input for the air mass flow calculation on the ECU.

The PFM is mounted downstream of the charge air intercooler and upstream of the throttle valve. Thereby, the PFM static pressure measurement can be used as boost pressure signal at this position.

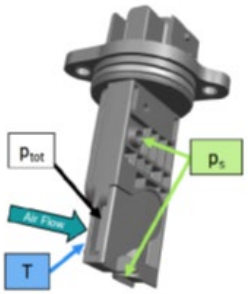
The temperature signal of the PFM can not only be used for the calculation of the air mass flow, but also as an additional temperature signal at the PFM position between the charge air intercooler and the throttle valve.

Explanation of characteristic data

$$\dot{m} = \sqrt{\frac{2 \cdot p_{diff} \cdot p_s}{R_s \cdot T}} \cdot A_{eff}$$

Signals of the 3 integrated sensors: p_{diff}, p_s, T

- $\dot{m}$ = Air mass flow
- p_{diff} = Differential pressure ($p_{diff}=p_{tot}-p_s$)
- p_s = Static pressure
- T = Temperature
- R_s = gas-constant for air
- A_{eff} = Effective area at mounting position



► Product groups

2.1 Lambda sensors

Type LSF-4.2 (Switching type)

► compared to the wideband lambda sensor LSU4.9 the switching type LSF4.2 type is limited to applications in the near operation vicinity of lambda=1

Application

Engine management
– Gas engines
– Combined heat and thermal power units (CHP)
– Gasoline engines

Industrial processes
– Tempering furnaces
– Chemical industry
– Packaging equipment
– Process engineering
– Drying plants
– Metallurgy

Measurement and analysis processes
– Flue gas measurement
– Gas analysis
– Determination of Wobbe index

Design and application

The LSF4.2 lambda sensor operates according to the principle of a galvanic oxygen concentration cell with solid electrolyte. The sensor element is in the form of a long wafer with rectangular cross section. The measuring cell and the heater are integrated in this planar ceramic. The measuring cell's surfaces are coated with microporous layers of noble metal. On the one side, due to their catalytic activity, these layers define the sensor's characteristic curve, while on the other they serve as contact elements. On the surface of the ceramic exposed to the exhaust gas, the noble-metal electrode is protected by a porous ceramic layer which, across the whole operating-temperature range, prevents erosion damage due to the deposits in the exhaust gas. This protective layer is applied using sintering techniques and, due among other things to its perfect adhesion and structure, it guarantees a long service life and compliance with the high functional demands made upon the sensor.

The heater is a wave-shaped element and contains noble metals. It is insulated, and integrated in the ceramic wafer. Even at low heater inputs it ensures that the sensor heats up quickly. The Lambda sensor operates as a reference-gas sensor, and compares the residual oxygen in the exhaust gas with the oxygen in the reference atmosphere (air circulating inside the sensor).
In the stoichiometric region of the air/fuel mixture (lambda = 1), there is a sudden jump in the sensor output voltage. The system is closed-loop controlled to lambda = 1 (two-state controller), and this voltage jump is evaluated in the 450...500 mV area of the system's characteristic curve.
The following approximate values apply as guidelines for sensor voltage:
– rich mixture (lambda < 1) 800...1000 mV,
– lean mixture (lambda > 1)
– in the area around 100 mV.

A prerequisite for efficient and reliable functioning is that the active sensor ceramic has a temperature of 350 °C. The integrated heater ensures that the sensor functions at exhaust-gas temperatures.

In addition, the direct sensor heating ensures that the sensor element heats up so rapidly that lambda closed loop control can come into operation within 10 secs. after engine start.
These advantages make an important contribution towards achieving low, stable exhaust-gas emission values. There are product variants with an additional "Thermal Shock Protection" (TSP). TSP increases robustness, especially against cold water droplets in cold start case of motor engines. An additional ceramic layer reduces the heat transition by distributing the drops to a larger area in case a water droplet hits the already heated sensor

Characteristics

– Field-proven,
– robust and compact,
– reliable,
– high-temperature-resistant up to 1000 °C exhaust-gas temperature
– resistant to stone impact,
– resistant to corrosion,
– isolated ground sensor signal circuit,
– low heater rating,
– stable control characteristic,
– short switch-on time.

► Product groups

2.2 Lambda sensors

Type LSU-4.9 (wideband)

- ► The wideband Lambda sensor LSU is a planar ZrO_2 dual-cell limit current sensor with integrated heater.
- ► It is used for measuring the oxygen content and the λ value of exhaust gases in vehicle engines.
- ► Thanks to a steady characteristic curve in the range λ = 0.65 to air, it is universally applicable for λ = 1 and for other λ ranges.

Application

Engine management
- Gas engines
- Combined heat and thermal power units (CHP)
- Diesel engines
- Gasoline engines
- Lean combustion engines

Industrial processes
- Tempering furnaces
- Chemical industry
- Packaging equipment
- Process engineering
- Drying plants
- Metallurgy

Measurement and analysis processes
- Flue gas measurement
- Gas analysis
- Determination of Wobbe index
- Incineration plants
- Wood
- Biomass

Design and operation

The LSU broadband Lambda sensor is a planar ZrO_2 dual-cell limit current sensor with integrated heater. It is suitable for measuring the oxygen content and the λ value of exhaust gases in vehicle engines (gasoline and diesel). A constant characteristic curve in the range from λ = 0.65 to air makes it suitable for universal use for λ =1 and for other λ ranges. The connector module includes a trimming resistor, which determines the characteristics of the sensor and is necessary for the sensor to function. To function, the LSU requires special operating electronics (e.g. ETAS LA4 or IC CJ125 evaluation circuit) and may only be operated in conjunction with these. The Lambda sensor consists of two cells. It is made up of a Nernst type potentiometric oxygen concentration cell and an amperometric oxygen pump cell. Nernst cells have the property that oxygen ions diffuse through their ceramic at high temperatures, as soon as there are differences in the partial oxygen pressure at both ends of the ceramic. The transport of ions results in an electrical voltage between them, which is measured using electrodes. The components of the exhaust gas diffuse through the diffusion duct to the electrodes for the pump and Nernst cell, where they are brought to thermodynamic equilibrium. Control electronics record the Nernst voltage U_N the concentration cell and supply the pump cell with a variable pump voltage U_P. If U_N takes on a value of less than 450 mV, the exhaust gas is lean and the pump cell is supplied with a current that causes oxygen to be pumped out of the duct. By contrast, if the exhaust gas is rich, U_N> 450 mV and the flow direction is reversed, causing the cell to pump oxygen into the duct. An integrated module (CJ125) can be used for signal evaluation. As well as the controller for the pump flow and the controller that keeps the Nernst cell at 450 mV, this module includes an amplifier. The sensor element is manufactured using thick-film techniques, which results in production distribution. This means that the characteristic curves for different sensors will vary. At an oxygen concentration of 0%, the output voltage is a uniform 0 V, as when using the evaluation circuit. However, at air the voltage scatters between approx. 6 and 8 V. This means that each sensor has to be individually calibrated so that a clear relationship between the measured oxygen concentration and the output voltage can be created. Calibration can be carried out on air in which the oxygen content is 20.9%. Calibration is recommended at each maintenance. There are product variants with an additional “Thermal Shock Protection” (TSP). TSP increases robustness, especially against cold water droplets in cold start case of motor engines. An additional ceramic layer reduces the heat transition by distributing the drops to a larger area in case a water droplet hits the already heated sensor. This allows an earlier signal readiness in the vehicle since it is possible to heat sensor already with engine start.

Installation instructions

- Installation in exhaust gas pipes at a location exhibiting a representative exhaust gas composition given compliance with the specified temperature limits.
- The ceramic sensor element warms up rapidly after switching on the sensor heating. Once the ceramic element has warmed up, the occurrence of condensate, which could damage the hot ceramic sensor element, must be avoided.
- If possible, the installation position should be vertically upwards, however at least at an angle of 10 ° with respect to the horizontal. This prevents the accumulation of liquid between the sensor housing and sensor element. An angle of 90 ° is desirable, however no greater than 90 ° + 15 ° gas inlet hole with respect to the exhaust gas flow or 90 ° - 30 °. Other angular positions are to be assessed separately if applicable.
- Tightening torque: 40 - 60 Nm, the material properties and strength of the thread must be designed accordingly.

2.4 Nitrogen-Oxide sensors

Gen 3 12/24 Volt

Precise measurement of the nitrogen oxide concentration in the exhaust gas

- Nitrogen oxide sensors ensure a reliable monitoring and control of the exhaust gas cleaning components in diesel engines.
- They precisely measure the nitrogen oxide concentration in the exhaust gas and support an efficient exhaust gas aftertreatment.
- In this way, Bosch nitrogen oxide sensors make a significant contribution to nitrogen-oxide reduction and compliance with applicable emission standards.

Application

Engine management
- Diesel engines
- Combined heat and thermal power units (CHP)
- H2 application
- CNG application
- Marine application

Industrial processes
- Tempering furnaces
- Chemical industry
- Packaging equipment
- Process engineering
- Drying plants

Design and operation

The NOx Gen3 is a technology designed to reduce nitrogen oxide (NOx) emissions from diesel engines, particularly in heavy-duty vehicles. This system utilizes advanced aftertreatment processes, including selective catalytic reduction (SCR) and diesel particulate filters (DPF), to effectively lower harmful emissions. The design focuses on optimizing the chemical reactions that convert NOx into harmless nitrogen and water vapor, thereby meeting stringent environmental regulations.

Advantages at a glance

- Reliable monitoring for compliance with applicable emission standards
- Long service life up to 250,000 km
- Especially robust and resistant sensor element thanks to a ceramic protective layer
- Simple and fast assembly thanks to the union screw
- Individually tested according to original equipment standards

Connector housing	5-pin	Hirschmann 872-978-...00
Contact pins (silver plated)		

Accessories are not included in the scope of delivery of the sensor and therefore to be ordered separately as required.

► Product groups

3.1 Pressure sensors

Differential pressure sensor

- ► Pressure range -100 to 500 kPa
- ► High level of accuracy
- ► With temperature compensation

Application

This sensor is used for either measurement of the differential pressure at the diesel particulate filter to determine its load condition, or fuel tank vapor pressure.

Design and operation

The piezo-resistive pressure sensor element and a suitable circuitry for signal amplification and temperature compensation are integrated on a silicon chip. The pressure measured operates to the back side of the silicon diaphragm, which is resistant to corrosive media and protected by a gel film against diaphragm cracks. The reference pressure operates from above to the active side of the silicon diaphragm. The upper chip surface and the wire-bonding onto the ceramic substrate are protected from corrosion by a anti-corrosive gel.

Explanation of characteristic data

p_e	Differential pressure
U_A	Output voltage (signal voltage)
U_V	Supply voltage
k	Tolerance multiplier
D	After endurance test
N	As-new condition

Installation instructions

The sensor is designed for attachment to the bodywork or to the engine of motor vehicles. The sensor should be installed to avoid condensate accumulating in the pressure cell or the reference opening (pressure sampling point at top of intake manifold, pressure connection angled downwards etc.). As a general rule, the installation position should ensure that liquids cannot accumulate in the sensor and pressure hose. If it freezes, water in the sensor can lead to malfunction.

3.2 Pressure sensors

Absolute pressure sensor

- ► Pressure range 0 – 1000 kPa
- ► High level of accuracy
- ► EMC protection better than 100 V m^{-1}
- ► With temperature compensation
- ► Version with additional integrated temperature sensor

Application

The sensor is used to measure the absolute intake-manifold or boost pressure. Some variants can be used to measure the absolute fuel or oil pressure. The version with integrated temperature sensor additionally measures the temperature of the detected medium.

Design and operation

The piezo-resistive pressure sensor element and a suitable circuitry for signal amplification and temperature compensation are integrated on a silicon chip. The measured pressure operates from above to the active side of the silicon diaphragm. Between the backside and a glass socket a reference vacuum is enclosed. The temperature sensor element is an NTC-resistor. By a suitable coating process the pressure and temperature sensor are protected against vapors and fluids existing in the intake-manifold, exhaust gas or exhaust gas condensate, however, may affect the sensor lifetime.

Explanation of characteristic data

U_A	Output voltage
U_V	Supply voltage
k	Tolerance multiplier
D	After endurance test
N	As-new condition

Installation instruction

The sensor is designed for attachment to a flat surface at the intake manifold of motor vehicles. The pressure connection and the temperature sensor jointly project into the intake manifold and are sealed off from the atmosphere by an O-ring. The sensor should be installed to avoid condensate accumulating in the pressure cell (pressure sampling point at top of intake manifold, pressure connection angled downwards etc.).

3.3 Pressure sensors

Pressure sensor for CNG

- Pressure range 20 – 1000 kPa
- High level of accuracy
- EMC protection up to 100 Vm^{-1}
- With temperature compensation
- Ratiometric output signal
- All sensors and sensor cells are resistant against natural gas (CNG)

Application

The sensor is used to measure and regulate the absolute pressure and the temperature in the fuel rail pipe of natural-gas systems that are operated with CNG. The fuel pressure sensor is resistant against natural gas (CNG).

Design and operation

The piezo-resistive pressure sensor element and a suitable circuitry for signal amplification and temperature compensation are integrated on a silicon chip. The measured pressure operates from above to the active side of the silicon diaphragm. The temperature sensor element is an NTC-resistor.

Explanation of characteristic data

U_A	Output voltage
U_V	Supply voltage
k	Tolerance multiplier
D	After endurance test
N	As-new condition

Installation instructions

The sensor has been designed for attachment to a flat surface. Both pressure port piece and temperature sensor project into the line, and sealing from the atmosphere is by means of an 0-ring. The hole on the customer side for holding and fastening the sensor in place shall be such that a permanently tight sit at the pressure port as well as stability towards the measuring medium will be assured. The installed position in the vehicle shall be only on the side of medium purity. Neither substances that can freeze nor any condensates at the pressure port are allowed, and neither shall be introduced during transportation of assembly.

3.4 Pressure sensors

Medium pressure sensor

- ► Pressure range 5 to 50 bar (absolute or relative)
- ► Highly precise measurement of fuel and oil pressure
- ► Integrated temperature sensor optional

Application

The medium-pressure sensor ensures rapid and highly precise measurement of fuel and oil pressure in every kind of combustion engine (gasoline, diesel, CNG, LPG) and transmission. The measurement is used to control the amount of fuel or oil supplied by the pump.

Design and operation

The sensor measures pressure by using a resistance bridge to evaluate the distortion of a silicon membrane. An integrated temperature sensor is optional. The pressure sensor can be equipped with a range of hydraulic interfaces and connectors. An optional temperature sensor can be integrated into the medium-pressure sensor. It measures temperature using an NTC (negative temperature coefficient) resistor connected to the evaluation element in the sensor. The pressure sensor can transmit the pressure and temperature readings as analog or digital signals (SENT).

Explanation of characteristic data

U_A	Output voltage
U_V	Supply voltage
bar	Pressure
U_S	Input voltage
p	Pressure [MPa]
C_O	0.1
C_1	$0.8 \cdot p / P_N$
P_N	Rated pressure [MPa]

Installation instruction

A suitable installation in the vehicle should be used to ensure that water cannot collect on the membrane.

The pressure sensor may only be handled at the hexagon while screwing. While mounting, a socket or ring wrench has to be used. This wrench may only be put at the hexagon and must cover it safely. Tilting or tipping of the socket or ring wrench with the device connector must be avoided. Open-end wrenches are no permitted for the assembly. While assembling the sensor, the device connector should not be rotated against the pressure port, else the sensor will be damaged. After the pressure sensor has been screwed into its installation position, it is tightened at the hexagon.

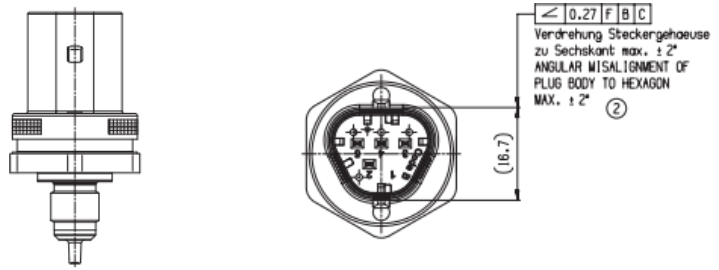
Dimensional drawings



Characteristic curve

► Product groups

High pressure sensor

- Pressure range 5 – 340 MPa
- Ratiometric signal evaluation (relative to supply voltage)
- Self-monitoring offset and sensitivity.
- Excellent media resistance (stainless steel)
- Resistant to brake fluids, mineral oils, fuel, water and air
- Protection against reverse polarity, overvoltage and short circuit of the output to supply voltage or ground

Application

High pressure sensors are used in motor vehicles to measure the pressure in the fuel rail of direct-injection gasoline and common-rail diesel engines or further hydraulic applications.

Design and operation

Use is made of polysilicon metal thin-film strain gauge elements. These are connected to form a Wheatstone bridge. This permits good signal utilization and temperature compensation. The measurement signal is amplified in an evaluation IC and corrected with regard to offset and sensitivity. Further temperature compensation is then implemented, so that the calibrated measurement cell and ASIC unit exhibits only a low degree of dependence on temperature. The evaluation IC also incorporates a diagnosis function for detection of the following possible faults:

- Break in bonding wire to measurement cell.
- Break in any signal wire at any point.
- Break in supply and ground wire at any point.

Explanation of characteristic data

U_A	Output voltage
U_V	Supply voltage
bar	Pressure
U_S	Input voltage
p	Pressure [MPa]
C_O	0.1
C_1	$0.8 \cdot p / P_N$
P_N	Rated pressure [MPa]

Installation instruction

The pressure sensor is designed for different use cases, which have different sealing concepts. Water must not be allowed to collect on the membrane.

The pressure sensor consists of a pressure port of metal and a housing of plastic. The pressure port has a sealing surface and a hexagon. The housing must not be twisted against the pressure port during installation. The pressure sensor has to be handled during screwing-in only at the hexagon. Tools for installation, e. g. socket wrench, must be applied only at the hexagon. After the pressure sensor has been correctly tightened to its installation position, a gap remains between the hexagon of the pressure sensor and the fuel rail or similar interface.

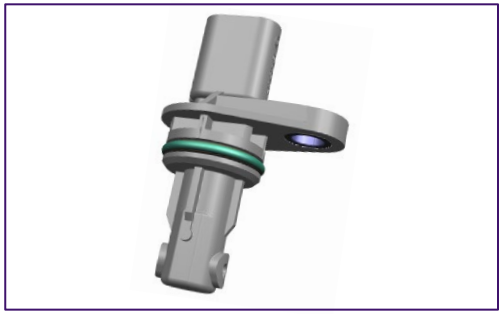
4.1 Rotational - Speed sensors

Sensors for Camshaft and Crankshaft Applications

- Precise and reliable digital measurement of rotation speed, angle position and rotation direction (crankshaft sensors)
- Non-contact measurement
- Hall IC sensor with open collector output
- Not susceptible to dirt
- Resistant to mineral oil products (fuel, engine oil)
- High robustness against electromagnetic interference (EMC)



Application

Hall speed sensors are ideal for non-contact, wear-free measurement of crankshaft speed, camshaft speed and similar applications.

Design and operation

Speed sensors are integral components of the engine management system in motor vehicles, typically installed in the engine or similar compartment. These sensors provide signals used to determine the position and rotational speed of the wheels, which are then processed by the ECU (Engine Control Unit). By detecting the teeth of a ferromagnetic target wheel, the sensor performs signal processing through an ASIC (Application-Specific Integrated Circuit) and transmits the processed signal to the ECU.

Crankshaft sensors identify additionally the rotation direction of the crankshaft wheel, enabling the detection of both forward and backward rotations during engine operation. This information allows the ECU to calculate the absolute position of the crankshaft after the engine stops, facilitating the implementation of a Start-Stop function in the engine control unit.

These speed sensors are equipped with a permanent magnet and a Hall IC (Integrated Circuit). As the ferromagnetic target wheel rotates in front of the sensor, the magnetic field of the internal magnet is modulated at the sensor's Hall probe(s). The sensor detects changes in the magnetic field at the transition between the tooth and slot of the ferromagnetic target wheel.

Explanation of characteristic data

n	Rotation Speed
U_S	Sensor supply voltage
U_{S_OUT}	Voltage on Rpull_up Resistor
I_S	Sensor supply current
t_f	Fall time (trailing signal edge).
t_r	Rise time (leading signal edge).

Installation instructions

- Please refer to installation conditions given in the offer drawing and Technical Customer Documentation (TCD)
- Route the connecting cables away from interference sources like ignition cables.
- Connect the ground connection of the sensor to the ECU ground pin to prevent issues arising from trigger level shifting and ground offsets.
- Protect the sensor against the destructive action of static discharge during insatllation.

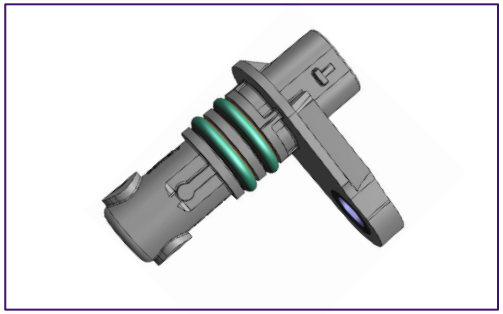
4.2 Rotational-speed sensors

Sensor for Transmission Applications (TRD)

- Precise and reliable digital measurement of rotation speed and rotation direction
- Two-wire interface
- Non-contact measurement
- Not susceptible to dirt
- Resistant to mineral oil products (fuel, engine oil)
- High robustness against electromagnetic interference (EMC)



Application

Hall speed sensors are ideal for non-contact, wear-free measurement of speed and direction in transmission applications.

Design and operation

The TRD sensor signal is used for the detection of the rotation speed and rotation direction in transmission applications.
The sensor detects the teeth of a ferromagnetic target wheel and the rotation direction, performs signal processing in the ASIC and transmits the processed signal to the control unit (CU).

TRD transmission rotation sensor with rotation direction detection contains a permanent magnet and a Hall IC. Due to the rotation of a magnetically soft target wheel in front of TRD the magnetic field is modulated at the place of the differential hall probe. The sensor detects magnetic differential fields at the transition between tooth and slot of the ferromagnetic target wheel. This modulation results in changes of the output signal. The magnetic field is evaluated by the differential hall probes in the ASIC.

Explanation of characteristic data

n	Rotation Speed
AG	Air Gap
U_S	Sensor supply voltage
U_{S_OUT}	Voltage on Rpull_up Resistor
I_S	Sensor supply current
t_f	Fall time (trailing signal edge).
t_r	Rise time (leading signal edge).

Installation instructions

- Please refer to installation conditions given in the offer drawing and Technical Customer Documentation (TCD)
- Route the connecting cables away from interference sources like ignition cables.
- Connect the ground connection of the sensor to the ECU ground pin to prevent issues arising from trigger level shifting and ground offsets.
- Protect the sensor against the destructive action of static discharge during installation.

4.3 Rotational-speed sensors

Inductive speed sensor

- ► Precise and reliable measurement of speeds
- ► Non-contacting measurement
- ► Not susceptible to dirt
- ► Resistant to mineral oil products (fuel, engine oil)

Application

Inductive speed sensors of this type are suitable for a variety of speed recording applications. Depending on design, they use completely non-contacting and wear-free methods to measure engine speeds (cam or crank) and convert these speeds into electrical signals.

Design and operation

The soft iron core of the speed sensor, surrounded by a winding, is positioned directly opposite a rotating trigger wheel and only separated from this by a narrow air gap. The soft iron core is connected to a permanent magnet, the magnetic field of which extends into the ferromagnetic trigger wheel, by which it is influenced. A tooth directly opposite the sensor concentrates the magnetic field and thus intensifies the magnetic flux in the coil. A gap on the other hand attenuates the flux in the coil. These two states alternate constantly due to the rotation of the ring gear. The transition from gap to tooth (leading tooth edge) and from tooth to gap (trailing tooth edge) produces changes in the magnetic flux which induce an alternating voltage in the coil in line with Faraday's law. The frequency of this voltage can be used for speed determination.

Per tooth the sensor supplies an output pulse, the magnitude of which is governed by the speed, the size of the air gap, the tooth shape and the rotor materials used. Together with the frequency, the amplitude of the output signal also increases with the speed. A minimum speed is therefore necessary to permit reliable evaluation of even very low voltages. A reference mark on the trigger wheel in the form of a large "tooth gap" permits determination of the position of the trigger wheel in addition to the actual speed measurement. The trigger wheel sensor ring forms part of the speed detection system. Sensor rings must be of a high technical standard to provide reliable speed information. Trigger wheel sensor ring specifications are available on request.

Explanation of characteristic data

U	Output voltage
n	Speed
s	Air gap

Installation instructions

- Standard Installation conditions guarantee full sensor functioning.
- Route the connecting cables in parallel to minimize interference.
- Protect the sensor against the destructive action of static discharge (CMOS components).

► Product groups

5 Structure-borne sound

Piezoelectric vibration sensor

- ► Reliable detection of structure-borne sound to protect machines and motors
- ► Piezo-ceramic element with high measurement sensitivity
- ► Sturdy compact design

Application

Vibration sensors of this this type are suitable for detecting structure-borne vibration occurring for example in motor-vehicle engines due to irregular combustion and in machines. Thanks to their robust design, these vibration sensors can withstand even the most severe operating conditions.

Areas of application

- Knock control for internal-combustion engines
- Machine-tool protection
- Cavitation detection
- Monitoring of pivot bearings
- Anti-theft systems

Design and operation

On account of its inertia, a mass exerts compressive forces on an annular piezo-ceramic element in the same rhythm as the vibrations causing them. As a result of these forces, charge transfer occurs within the ceramic element and a voltage is generated between the upper and lower sides of the ceramic element. The voltage is tapped via contact washers - often filtered and integrated - and is available for use as a measurement signal. Vibration sensors are bolted to the object to be measured so as to relay the vibrations at the measurement location directly to the sensors.

Explanation of characteristic data

E	Sensitivity
F	Frequency
g	Acceleration due to gravity

Measurement sensitivity

Each vibration sensor has individual transmission characteristics closely related to the measuring sensitivity. The sensitivity is defined as the output voltage per unit of acceleration due to gravity (refer to characteristic curve). The production-related sensitivity scatter is acceptable for applications in which the main emphasis is on recording the occurrence of vibrations rather than on their amplitude. The low voltages supplied by the sensor can be evaluated using a high-impedance AC voltage amplifier.

Installation instructions

The sensors must rest directly on their metal surfaces. Use must not be made of packing plates, spring or toothed lock washers for support. The contact surface of the mounting hole must be of high quality to ensure low-resonance coupling of the sensors to the measurement location. The sensor cable is to be laid such that no resonance vibration can occur. The sensor must not be allowed to have contact with liquids for lengthy periods.

6 Temperature sensors

Temperature sensor for air/liquid

- ► Temperature range -40C - 130C
- ► Measurement of air, coolant, fuel and oil
- ► Measurement with temperature sensitive resistors
- ► Broad temperature range

Application

The temperature sensor is a sensor, converting a temperature into an electrical signal. Available for air, coolant, fuel and oil temperature measurement.

In motor vehicles they are used to measure the temperature of the intake air in the range -40...130 °C.

Design and operation

NTC thermistors have a negative temperature coefficient, i. e. their conductivity increases with increasing temperature; their resistance decreases. The conductive element of the temperature sensor consists of semi-conducting heavy metal oxides and oxidized mixed crystals pressed or sintered into wafers or beads with the aid of binding agents and provided with a protective casing. In combination with a suitable evaluation circuit, such resistors permit precise temperature determination. Depending on the housing design, the sensors are suitable for measuring temperatures in liquids and gases.

Explanation of characteristic data

R	Resistance
ϑ	Temperature

Installation instructions

The sensor is installed such that the front section with the sensing element is directly exposed to the fluid flow.

Temperature sensor for air/liquid

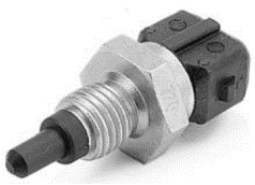
Product type

TF-L

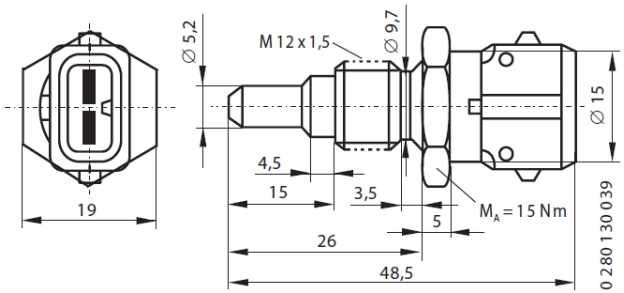
Part number

0 280 130 039

Picture



Dimensional drawings



Technical data

Temperature range	°C	-40 ... + 130
Features	Sensor in steel housing with threaded connection.	
Application/medium		air
Rated resistance at 20 °C	kΩ	2,5 ± 5 %
Resistance at -10 °C	kΩ	8,727 ... 10,067
Resistance at +20 °C	kΩ	2,375 ... 2,625
Resistance at +80 °C	kΩ	0,296 ... 0,349
Nominal voltage	V	5 ± 0,15
Max. measurement current	mA	1
Self-heating with max. perm. Power loss of P = 2 mW and still air (23 °C)	K	≤ 2
Temperature/time constant τ_{63} [1)]	s	≤ 45
Approximate value for permissible Vibration acceleration a_{sin} (sinusoidal vibration)	m/s²	300
Corrosion-tested as per		DIN 50 018
Degree of protection		IP6K9K
Tightening torque	Nm	15 ± 2
Thread		M12 x 1.5

[1)] Time required to attain a difference in resistance of 63% of the final value given an abrupt change in measurement temperature from 20°C to 75°C; flow velocity of air 6 m/s.

Accessories

Connector housing	2-pin Jetronics connector, tin plated terminals	
Connector housing	2-pin	1 928 402 078
Protective cap	Temperature-resistant	1 280 703 031
Contact pins	For Ø 0.5...1.0 mm²	AMP 929 939-3
Contact pins	For Ø 1.5...2.5 mm²	AMP 929 937-3
Individual seal	For Ø 0.5...1.0 mm²	1 987 280 106
Individual seal	For Ø 1.5...2.5 mm²	1 987 280 107

Accessories are not included in the scope of delivery of the sensor and therefore to be ordered separately as required.
